The all-new electric GLC: A focus on sustainability

The all-new electric GLC achieves a two-thirds reduction in carbon footprint across its entire lifecycle compared to the current combustion-powered GLC.

Reduction of carbon emissions in production and supply chain

- **Carbon-reduced aluminium:** Mercedes-Benz already sources carbon-reduced aluminium for more than two-thirds of the vehicle's aluminium requirements. In addition to the body and steering knuckles, the aluminium wheels and the battery, including its housing, are made from aluminium that has a carbon footprint reduced by at least 40 percent¹ compared to the conventional import mix. This is achieved by using both renewably generated electricity in the electrolysis process and a high proportion of recycled aluminium for production.
- **New battery generation:** The carbon footprint of the new lithium-ion battery is also reduced by approximately 30 percent per cell compared to conventional production through carbon reduction measures in the high-voltage cell. In addition to net carbon-neutral² cell production, renewable energy is also used in the production of cathode, anode and cell housing materials. The proportion of cobalt has been further reduced. The battery has a usable energy content of 94 kWh.
- **Use of secondary materials:**
 - The seats incorporate secondary materials throughout their construction – from the seat cover and seat foam to the substructure and metal components. The seat foam contains around 30 percent recycled content, for example.
 - For the high-quality comfort seat, Mercedes-Benz offers a black ARTICO man-made leather upholstery with a backing textile made from recycled PET bottles. The MICROCUT microfibre upholstery is also manufactured 100 percent from post-consumer recycle. PET bottles are processed into regranulated yarns, which are then converted in a complex microfibre process into a high-quality, robust fleece that looks and feels like suede.
 - Econyl yarn made from 100 percent recycle is used for the floor covering in the footwell and boot.
 - For the overall vehicle, the recycled content in the thermoplastics has been more than doubled compared to the current GLC.
- **Net carbon-neutral² production:** The new electric GLC will be produced net carbon-neutral at the Bremen plant. This plant is supplied with 100 percent green electricity, which is largely purchased externally.

¹ Per kilogram of aluminium

² Net carbon-neutral means that carbon emissions that are not avoided or reduced at Mercedes-Benz are compensated for by certified compensation offsetting projects.

Reduction of carbon emissions during use phase

- **Outstanding range:** The all-electric GLC has a range of over 600 kilometres according to WLTP³. Up to 260 kilometres³ can be recharged within ten minutes.
- **Standard multi-source heat pump:** It combines efficiency with high thermal comfort. The air-side heat pump uses waste heat from the electric drive unit, the battery and ambient air to heat the cabin. It uses about one-third of the electrical energy that a comparable electric auxiliary heater would require under the same conditions.
- **High recuperation performance:** The GLC is equipped with a new One-Box braking system. For efficiency reasons, almost all braking processes are carried out entirely through recuperation. The recuperation performance is up to 300 kW, which significantly contributes to increasing range.
- **Prepared for bidirectional charging:** The GLC is prepared for the integration with the power grid. When the vehicle is connected to a compatible bidirectional DC charging station, it can, for example, store solar energy for later use or act as a power supplier, either Vehicle-to-Home (V2H) or Vehicle-to-Grid (V2G).
- **Access to one of the largest charging networks worldwide:** The charging network accessible via MB.CHARGE Public⁴ now has more than 2.5 million charging points and is one of the largest charging networks worldwide. In Europe, users can charge at over 850,000 charging points across several countries with just one MB.CHARGE Public charging contract.
- **„Green Charging“:** This is an integral component of MB.CHARGE Public in Europe, Canada and the USA. If a station is not yet supplied with renewable energy, “Green Charging” employs renewable-energy certificates to ensure that an equivalent amount of clean electricity is fed into the grid for each charge. These certificates are sourced from certified energy generation plants⁵ that are less than six years old⁶. The green electricity certificates are, where possible, purchased and redeemed in the same country in which the customer is charging, thereby supporting the growth of renewable energy.

Sustainability through digitalisation

- **Navigation with Electric Intelligence:** The system plans the fastest and most comfortable route including charging stops and reacts dynamically to numerous factors such as traffic jams or changes in driving style. MBUX visualises the current state of battery capacity, shows the expected charging costs per charging stop and provides energy-saving tips.
- **Mercedes-Benz Operating System (MB.OS):** With MB.OS 1, over-the-air updates⁷ for all vehicle software are possible. The update performance is significantly better than that of the predecessor, enabling more efficient software power and lower energy consumption.
- **DIGITAL LIGHT:** Next-generation DIGITAL LIGHT features micro-LED technology and a powerful chip – for increased brightness with up to half the energy consumption.

World's first vegan-certified interior equipment

- **Tomorrow drives Mercedes-Benz:** For interior materials, this means not only consistently increasing the proportion of recycled materials but also offering customers a vegan interior with the greatest level of safety and transparency.
- **That's why Mercedes-Benz has had all soft-touch surface materials in the vehicle interior, such as microfibre fleece, textiles and man-made leather, certified by the independent organisation The Vegan Society.**

³ The information is provisional. Neither confirmed values from an officially recognised testing organisation nor an EC-type approval nor a certificate of conformity with official values are available to date. Deviations between the data and the official values are possible.

⁴ In order to be able to use the Digital Extra MB.CHARGE Public, a separate customer-specific charging contract with a selected third-party provider is required.

⁵ EKOenergy in Europe, Green-e in North America.

⁶ Secured in all countries except the UK and Poland.

⁷ In order to use the Digital Extras, the customer must create a Mercedes me ID and agree to the Terms of Use for Digital Extras and the Mercedes me ID Terms of Use as amended from time to time. In addition, the respective vehicle must be linked to the user account. At the end of the limited term, the Digital Extras can be extended for a fee, provided they are still offered for the vehicle in question.

- The globally renowned certification organisation has audited around 100 material components from various suppliers. If there were any indications that they contained animal-based components, the materials underwent further development in cooperation with the respective supplier, and the affected components were replaced by other, animal-free components or auxiliaries.
- With the GLC, Mercedes-Benz is the world's first car manufacturer to offer vegan interior equipment certified by The Vegan Society. The new Vegan Package includes all soft-touch surface materials in the vehicle interior – from the seat upholstery to headliner, from pillar and door panels to carpeting.
- Customers can be assured that these vegan materials contain no animal-derived products.

Mercedes-Benz AG at a glance

Mercedes-Benz AG is part of the Mercedes-Benz Group AG with a total of around 175,000 employees worldwide and is responsible for the global business of Mercedes-Benz Cars and Mercedes-Benz Vans. Ola Källenius is Chairman of the Board of Management of Mercedes-Benz AG. The company focuses on the development, production and sales of passenger cars, vans and vehicle-related services. Furthermore, the company aspires to be the leader in the fields of electric mobility and vehicle software. The product portfolio comprises the Mercedes-Benz brand with Mercedes-AMG, Mercedes-Maybach and G-Class with their all-electric models as well as products of the smart brand. Mercedes-Benz AG is one of the world's largest manufacturers of high-end passenger cars. In 2024 it sold around 2.4 million passenger cars and vans. In its two business segments, Mercedes-Benz AG is continually expanding its worldwide production network with more than 30 production sites on four continents, while gearing itself to meet the requirements of electric mobility. At the same time, the company is constructing and extending its global battery production network on three continents. As sustainability is the guiding principle of the Mercedes-Benz strategy and for the company itself, this means creating lasting value for all stakeholders: for customers, employees, investors, business partners and society as a whole. The basis for this is the sustainable business strategy of the Mercedes-Benz Group. The company thus takes responsibility for the economic, ecological and social effects of its business activities and looks at the entire value chain.
